Part 1 Fundamentals

1 Spring in the real world

1.1 Why should we use frameworks?

1.2 The Spring ecosystem

Discovering Spring Core: The foundation of Spring

Using Spring Data Access feature to implement the app's persistence

The Spring MVC capabilities for developing web apps

The Spring testing feature

Projects from the Spring ecosystem

1.3 Spring in real-world scenarios

Using Spring in the development of a backend app

Using Spring in a test automation app

Using Spring for the development of a desktop app

Using Spring in mobile apps

1.4 When not to use frameworks

You need to have a small footprint

Security needs dictate custom code

Abundant existing customizations make a framework impractical

You won't benefit from switching to a framework

1.5 What will you learn in this book

2 The Spring context: Defining beans

2.1 Creating a Maven project

2.2 Adding new beans to the Spring context

Using the @Bean annotation to add beans into the Spring context

Using stereotype annotations to add beans to the Spring context

Programmatically adding beans to the Spring context

3 The Spring context: Wiring beans

3.1 Implementing relationships among beans defined in the configuration file

Wiring the beans using a direct method call between the @Bean methods

Wiring the beans using the @Bean annotated method's parameters

3.2 Using the @Autowired annotation to inject beans

Using @Autowired to inject the values through the class fields

Using @Autowired to inject the values through the constructor

Using dependency injection through the setter

3.3 Dealing with circular dependencies

3.4 Choosing from multiple beans in the Spring context

4 The Spring context: Using abstractions

4.1 Using interfaces to define contracts

Using interfaces for decoupling implementations

The requirement of the scenario

Implementing the requirement without using a framework

4.2 Using dependency injection with abstractions

Deciding which objects should be part of the Spring context

Choosing what to auto-wire from multiple implementations of an abstraction

4.3 Focusing on object responsibilities with stereotype annotations

5 The Spring context: Bean scopes and life cycle

5.1 Using the singleton bean scope

How singleton beans work

Singleton beans in real-world scenarios

Using eager and lazy instantiation

5.2 Using the prototype bean scope

How prototype beans work

Prototype beans in real-world scenarios

6 Using aspects with Spring AOP

6.1 How aspects work in Spring

6.2 Implementing aspects with Spring AOP

Implementing a simple aspect

Altering the intercepted method's parameters and the returned value

Intercepting annotated methods

Other advice annotations you can use

6.3 The aspect execution chain

Part 2 Implementation

7 Understanding Spring Boot and Spring MVC

7.1 What is a web app?

A general overview of a web app

Different fashions of implementing a web app with Spring

Using a servlet container in web app development

7.2 The magic of Spring Boot

Using a project initialization service to create a Spring Boot project

Using dependency starters to simplify the dependency management

Using autoconfiguration by convention based on dependencies

7.3 Implementing a web app with Spring MVC

8 Implementing web apps with Spring Boot and Spring MVC

8.1 Implementing web apps with a dynamic view

Getting data on the HTTP request

Using request parameters to send data from client to server

Using path variables to send data from client to server

8.2 Using the GET and POST HTTP methods

9 Using the Spring web scopes

9.1 Using the request scope in a Spring web app

9.2 Using the session scope in a Spring web app

9.3 Using the application scope in a Spring web app

10 Implementing REST services

10.1 Using REST services to exchange data between apps

10.2 Implementing a REST endpoint

10.3 Managing the HTTP response

Sending objects as a response body

Setting the response status and headers

Managing exceptions at the endpoint level

10.4 Using a request body to get data from the client

11 Consuming REST endpoints

11.1 Calling REST endpoints using Spring Cloud OpenFeign

11.2 Calling REST endpoints using RestTemplate

11.3 Calling REST endpoints using WebClient

12 Using data sources in Spring apps

12.1 What a data source is

12.2 Using JdbcTemplate to work with persisted data

12.3 Customizing the configuration of the data source

Defining the data source in the application properties file

Using a custom DataSource bean

13 Using transactions in Spring apps

13.1 Transactions

13.2 How transactions work in Spring

13.3 Using transactions in Spring apps

14 Implementing data persistence with Spring Data

14.1 What Spring Data is

14.2 How Spring Data works

14.3 Using Spring Data JDBC

15 Testing your Spring app

15.1 Writing correctly implemented tests

15.2 Implementing tests in Spring apps

Implementing unit tests

Implementing integration tests

appendix A Architectural approaches

appendix B Using XML for the context configuration

appendix C A quick introduction to HTTP

appendix D Using JSON formatting

appendix E Installing MySQL and creating a database

appendix F Recommended tools

appendix G Recommended learning materials for further study
